Handbook Of Refractory Carbides Nitrides

Refractory carbides and nitrides are materials with a high melting point, arbitrarily selected as greater than 1800°C and must have a high degree of chemical stability. Carbides and nitrides can be divided into several types depending on their different physicochemical structures and characteristics.

In cemented carbides, typically 60–95 vol.% of the carbide phase is bonded by a more ductile metal, invariably a cobalt, nickel or iron alloy. The most important refractory carbides are WC, TiC and TaC; annual world production of these carbides is about 20 kt, 1.5 kt and 0.35 kt, respectively. Production of refractory WC represents about half the annual tungsten production for civil uses.
