The following results are obtained from the procedure outlined by H.F. Weinberger in "A First Course in Partial Differential Equations" (Wiley & Sons, New York, 1965, pp.41-47.) For a given point, (x o,to),the PDE is categorized as follows: If B2 – 4 AC> 0 then the PDE is hyperbolic. If B2 – 4 AC= 0 then the PDE is parabolic.

In this video I have discussed how to find the solution for partial differential equations by direct integration method.

Solution of Partial differential equations.

Section 9-8 : Vibrating String. This will be the final partial differential equation that we'll be solving in this chapter. In this section we'll be solving the 1-D wave equation to determine the displacement of a vibrating string.

From X#(1) = –X(1), we find that –c2μ2sinμ + c2μcosμ = –c2μcosμ – c2sinμ. Hence μ is a solution of the equation –μ2sinμ +μcosμ = –μcosμ –sinμ ⇒ 2μcosμ =(μ2–1)sinμ Note that μ = ±1 s not a solution and cosμ = 0 is not a possibility, since this would imply sinμ = 0 and the twoequations have no common solutions.

Thus the solution of the partial differential equation is u(x,y)=f(y+ cosx). To verify the solution, we use the chain rule and get ux = –sinxf0 (y+ cosx) and uy = f0 (y+cosx). Thus ux + sinxuy = 0, as desired.

(page 319). Three-Dimensional wave equation is presented most effectively and segues to more complex variable techniques (pages 333-337). Fourier and Laplace transforms in much detail, here. In fact, you will utilize the Laplace transform for ordinary differential equations as preliminary to those for partial differential equations.
